Window Film General Terms and Conditions

Drying Time

_____ Your New window film will take 2 - 3 days before you can roll or clean your windows. It will take 3 - 4 weeks to fully cure depending on weather conditions.

Black Dotted Edges

_____ Most cars have a black ceramic edge on the side and rear windows. Sometimes these ceramic edges are straight and flat, sometimes it will have a dotted edge. These black ceramic dots are quite thick on most cars and prevent the window film from sticking to the area between the dots. This results in a whitish looking strip trimming the glass. Unfortunately, the effect is unavoidable.

Film, Badge, & Decal Removal

_____ Film, badge, and decal removal may cause the paint to be damaged. By authorizing Automotive Film Specialists, LLC to proceed with removal, the client hereby acknowledges the risk, waives any claims against DWRAPS INC, and agrees that DWRAPS INC , will not be liable in the event that damage does occur during the removal process.

Imperfections

_____ Though we strive for perfection in our installations, due to the nature of the product, some degree of dust contamination and or minor imperfections are present in every window film application, also pre-existing flaws or scratches and metal deposits on the glass are often much more noticeable afer the window are tinted. Older vehicles will have more imperfections due to its age.

Windshield Film Installation

_____ There will be minor imperfections present in every windshield installation. It will be easier to see due to the film being installed on the front windshield. Do not apply any decals, or windshield accessories on windshiled for 7 days. There are no refund and warranty coverage on rainbow effect due to wearing polarized sunglasses.
